

xcrun: error: invalid active developer path

Author : Tobias Hofmann

Date : November 27, 2017

Mac is a nice computer for developing, MacOS and Apple can make your developer life a challenge. After updating XCode - after all, why have a Mac when you do not develop iOS apps - it may happen that git stops working.

Running git gives you:

```
xcrun: error: invalid active developer path (/Library/Developer/CommandLineTools), missing xcrun at: /Library/Developer/CommandLineTools/usr/bin/xcrun
```

Usual situation: it worked yesterday, today it is broken and you did nothing. Besides updating XCode. The problem occurs easily. When you update XCode, normally you also update the command line tools.

In case the Apple App Store isn't giving you the option to update the command line tools, run the command

```
xcode-select --install
```

Output

It's full of stars!

~~Where documentation meets reality~~

xcode-select: note: install requested for command line developer tools

This should either install the command line tools and give you back a working git tool, or let you install the tools manually via the App Store.

After this, git should be working again. Happy coding.
